

Learning ①

The process of learning is continuous which starts right from birth or from the time of birth of an individual and continues till the death.

Learning is generally defined as relatively permanent changes in behaviour, skills, knowledge or attitudes resulting from identifiable psychological or social experiences. A key feature is permanence. Changes do not count as learning if they are temporary. You do not "learn" a phone number if you forget it the minute after you dial the number, you do not "learn" to eat vegetables if you only do it when forced. Meaning in learning the change has to last. Notice, though, that learning can be physical, social, or emotional as well as cognitive. You do not "learn" to sneeze by simply by catching cold, but you do learn many skills and behaviours that are physically based, such as riding a bicycle or throwing a ball. You can also learn to like or (dislike) a person, even though this change may not happen deliberately.

Psychologists in general define learning as relatively permanent behavioural modifications which take place as a result of experience.

* Gales defined learning as the behavioural modification which occurs as a result of experience as well as training.

* Crow and Crow defined learning as the process of acquisition of knowledge, habits and attitudes.

Therefore learning is simply put as the process by which we acquire knowledge, skills, attitudes, values and behaviours through experience, practice or instruction. It involves transferring information to knowledge and the application of that knowledge toward the application of that knowledge to achieve a goal or solve problems.

* TYPES OF LEARNING:-

1) Verbal Learning:- Simply put is learning through languages and verbal instruction. It involves acquiring new skills through reading, listening and speaking.

2) Observational Learning:- Propounded by Albert Bandura in his social learning theory which focus on learning by imitation or observing people's behaviour, attitudes or knowledge.

3) Experiential Learning:- Learning through direct experience or learning by doing rather than watching or listening e.g. a house-keeper and supervisor practical teaching or ~~instincts~~ ^{instincts}.

METHODS OF LEARNING:-

4) Physical Learning:- This ~~method~~ ^{method} of learning prefer a hands-on experience rather than listening to lectures or sitting in a class. This method encompasses interacting physically with things that are tangible in nature. These methods of learning could be the idea of studying the hours as a daunting experience but are better with actually doing things practically. e.g. simulation and real world application.

5) Visual Learning:- This ~~method~~ ^{method} of learning is common with learning through images, charts, pictures, diagrams, here learners learn best with the help of charts as mentioned, it helps learners to use their ~~visual~~ ^{visual} memory to retain information for longer periods of time. Many visual learners have a good attention span and are extremely observant and they prefer visual directions.

③ Auditory Learning - People who tends to understand and retain information by hearing it or by saying it out ~~loud~~ loud (~~out~~ ^{out}) are called auditory learners. i.e. learning through sounds, music or oral instruction e.g. audio books, lectures. The learners usually prefer discussing topics, participating in debates and discussing about things to remember them.

* ATTITUDE

An Attitude refers to a set of emotions or ideas, beliefs and behaviours towards a particular object, person, thing or event.

Attitude can also be described as the way we are towards something or someone, e.g. we tend to respond positively or negatively about certain subjects for instance

- * Death penalty
- * Whoa you are sick
- * Getting a ~~new~~ good job or admission into high school

TYPES OF ATTITUDES

- ① Positive - favourable disposition towards an object or issue
- ② Negative - unfavourable disposition towards an object or issue
- ③ Neutral - lack of strong feelings or opinion towards an issue or event

COMPONENTS OF ATTITUDES

① Affective - Refers to how the object, person, issue or event makes you feel. e.g. I hate John because he always say bad things about me. etc

② Behavioural Component - Refers to how you respond to someone or something that elicits a set of

feelings and beliefs it can be used for physical responses e.g when your team is (Manchester) win a game.

③ Cognitive component - Refers to your perception, ideas and beliefs about the subject matter e.g sure belief that examination malpractice is dangerous while others believe it is the only way out.
